

## GRCDrop.exe

---

GRCDrop.exe, when run, will look for a GRC.dat file located in the same directory that the application is found in. If the file is found and SAV Client is installed on the machine, the GRC.dat file will be copied into the directory where it will be processed by SAV.

GRCDrop.exe is compatible with all versions of SAVCorp from 7.0 to the current version. It is also compatible with all Windows Operating Systems. GRCDrop.exe will automatically determine the proper location to copy the file to based on these two criteria.

In case any errors occur, a log file named "GRCDrop.err" will be generated. Open it with any text viewer to see the error. If you add "/i" to the command-line arguments for interactive use, the error messages will appear in Message Boxes on the screen, rather than being logged to a file.
